Discussion Points:

1. Medical student’s role in a war
2. What can a medical student learn in a hospital during a war?
3. How medical student can help to soldiers?
4. Volunteering in a hospital during the pandemic and war
5. Medical students should be ready to work with a team during the affairs.

Publisher’s Disclosure: This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our readers and authors we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final citable form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.
THE EXPERIENCE.

War is always a damaging situation for the parties involved; no matter which one wins at the end, there is always something to lose, such as soldiers, money, and the nation’s safety.

Due to the pandemic, we could not attend our university in Ankara, Turkey, between the march of 2020 and January of 2021. Like many other universities in the world, classes in my university also turned online because of the pandemic. I was confronted with the pandemic’s difficulties, like the uncertainty of the period and the quality of distance learning. I was in my home country (Azerbaijan, located in Caucasus region, in the coasts of Caspian Sea) and was attending online classes and having my routine study day. On the 27th of September 2020, we heard a war started between Armenia and Azerbaijan on the western side of Azerbaijan called the Nagorno-Karabakh region, a mountainous and forested region located in the south Caucasus. It was a tremendous war with more than a hundred thousand military personnel attending on both sides.

The soldier recruitment nationally started on the same date. The news from the war was not good for both sides; there were too many dead and injured soldiers each day. Hundreds of wounded soldiers were brought to nearby hospitals, and there was a need for extra medical personnel. I applied to several authorities as a volunteer to help the personnel for medical care to wounded soldiers; in the end, I was able to go to Salyan Central Hospital in Salyan (150km away from the war zone). In the meantime, televisions announced news regarding the end of the conflict. However, the number of injured soldiers was increasing on a large scale every day.

Since the hospital where I was volunteering was not at the war zone, the soldiers were sent there from the field hospitals after the first aid was applied. I was assigned with the team of doctors to apply tasks that given by the hospital administration. I was helping with the admission of soldiers to hospital rooms, primary surgical treatment like suturing, bandage change, and physical examination. I saw different types of injured soldiers; they mostly came with extremity wounds, trunk wounds, and concussions due to explosions. I was mainly affected by the soldiers who had concussions. They were in a strange condition; they could barely talk, comprehend, or walk. Most of them even did not know where they were and what happened exactly. I had an opportunity to talk with some of the soldiers, and their thoughts were touching; most of them wanted to go back to war and help their companions despite their health conditions. While watching their medical conditions, I felt sorrow and despair as many of them would live with the psychological and physical effects of the war.

It was an exhausting period as COVID-19 was worsening the situation in hospitals, and no one knew when the war would end. The number of cases was increasing day by day. So many of the doctors were in a fight with COVID, and some of them were infected and could not work. The situation was complicated as doctor absence was present, and the help of medical students was necessary for hospitals. Moreover, the patient overload in hospitals increased the risk of infection spread.

Despite the fear of the pandemic, we were working day and night with our best. Ambulances were transporting the soldiers to nearby hospitals from the war zone, doctors were giving their best to cure the injured soldiers, hospital personnel was making every effort to help, and medical students like me were giving our best in every
possible situation within the hospitals. I have experienced that in a war situation, the body’s resistance increases against the exhaust.

The war took nearly two months and ended on the 10th of November 2020; it cost more than 6500 lives in total from both sides. I had an exceptional experience during that time. No matter how the war was an unfavorable event during the pandemic, I have learned how to work under time and emotional pressure at the very early stages of my life. Moreover, working in a team to deliver the best practice was another significant experience I have gained during the war. Therefore, I can advise medical students that they should feel ready to help in emergency situations like a war in case of need, as your help may be more important than you thought.

In conclusion, the war period was one of great triumph and sadness. Wounded and dead soldiers from both sides were the black side of the war, which influenced both nations. As many of the doctors were in a fight with COVID-19, in this doctor absence and patient overload, the help of medical students was crucial during the war period. That experience of mine shows that medical students can also take a significant role during the war in healthcare. Volunteering in a hospital during the war was a strange experience and feeling that will last a lifetime on my memory.
