The Utility of Online Resources in Times of COVID-19: A Mexican Medical Student Point of View

Aldo Mijail Pacheco Carrillo.

The Experience

It has been four months since November 2019 when the SARS-CoV-2 outbreak started in Wuhan, China. At the beginning there were medical students who did not believe that the disease would reach Latin America and that news was overstated, as of right now coronavirus disease is a particular burden on the health care systems of many countries including Mexico, mainly due to the lack of resources in public hospitals. It also impacts on the medical education of the country because all universities commanded their students to stay home so the government could handle the situation, firstly for 3 weeks, but it seems that the time of quarantine might be more. Meanwhile many students and professors are still battling to do online lectures because, in contrast to the U.S.A. education system, here in Mexico most of the lectures at university require the student in the classroom, that is why teachers are not used to web lessons.

I have noticed that many of my classmates did not really know the existence of online courses and the quality they may have, it occurs the same with web workshops and other certificate offering resources that many people, including myself, have used to gain extracurricular knowledge in matters of research, clinical applied knowledge and more. So far in a week I have taken a course about antibiotics provided free by Stanford university, another one about how to use Mendeley by Elsevier online campus and one more course about important information about covid-19 by the Mexican Institute of Social Security, while I attending my regular lectures using the app Zoom to chat with my professors and classmates. I must admit that the quality of online regular lectures are not the same as the presential lectures I get at the university. One out of ten times the internet connection will make very loud interference noise causing the online reunion to end prematurely. However, I see more advantages than disadvantages, for example, I take most of the classes at my desk or bed, to be honest, I feel comfortable doing it. I also have more time to exercise at home and to cook healthy food, on the other hand, the only bad thing I see is the risk of social isolation leading to depression. In my case, I stay with my family and keep contact with my friends by using social media, but for the people living alone the situation could be dangerous. Additionally, I have noticed that many of my friends are spending more time in social media and streaming platforms instead of investing time exploring online academic resources. Maybe because they don’t know of their existence.

How are online resources a great window of learning opportunity? There are plenty of online courses and many of them allow you to fulfill their objectives in a very generous space of time. For example, I took a course about how to write a paper in English with twenty hours of lectures through 8 weeks. Besides the time efficiency, a student can learn something he hasn’t seen yet but he will soon, turning the online courses into a flipped classroom that has been proved to generate strong positive perceptions on evaluation surveys and benefit the student knowledge and learning process.

Are online resources proven to be beneficial to students? Depending on the resource, it has been proved that online platforms providing study tools have a positive effect as long as the student participates actively (answering questions and taking notes). Further, open online courses have reported to have a huge potential improving soft-skills and research skills, and although they cannot replace the traditional model, they can be added as a complement and a way to encourage self-directed learning skills. A previous study demonstrated that touch screen device apps improve information retrieval and conceptual understanding.

Are online courses and study platforms valid options in times of COVID-19? Considering the long time, we will not be able to go out, the short answer is yes. Online resources have shown benefits for learners in terms of engagement, convenience, attainment and enjoyment. I think they are comfortable as well as they generate compromise. In fact, they could be entertaining. Despite the limitations, I think they represent an important tool for medical students around the world.

In summary, we live in an unprecedented time, the covid19 outbreak has paralyzed the world including medical students. They remain in quarantine in the hope that the pandemic will end. The Latin America countries are particularly affected by their lack of resources and the time when medical students return to the universities is lengthening. Meanwhile the use of online platforms to resume the classes and the variety of online courses to complement the learning seems promising and should be more widely disseminated.
